

UBUNTU SERVER BOOT PROCESS FLOWCHART

ITEP 414 – System Administration and Maintenance | Week 3

Prepared by: Ralph Rio H. Bautista

Flow: Firmware initializes the platform, identifies a boot device, GRUB loads the Linux kernel, systemd initializes userspace and services, and the system presents a login prompt.

Boot Stage Explanations

Stage	Purpose
Power On	Starts the physical or virtual machine.
BIOS / UEFI	Initializes hardware and selects a boot target.
Boot Device Detection	Identifies the device containing boot files.
GRUB	Loads the Linux kernel and boot parameters.
Linux Kernel	Initializes hardware and core OS functions.
systemd	Initializes userspace and manages services.
Services Start	Starts networking, SSH, logging and other services.
Login Prompt	Provides the authentication interface.

Note: Exact behavior can vary by Ubuntu release and virtual hardware configuration.
